

National Defense Industrial Association

Implementing Continuous Iterative Development and Acquisition

Executive Summary

**NDIA Systems Engineering Division
in partnership with INCOSE and PSM**

22-Apr-2019

Background

Defense Science Board (DSB) released a report in Feb-2018 containing seven recommendations regarding software design and acquisition. Section 868 of NDAA 2019 mandates implementation of these recommendations within 18 months.

The Defense Innovation Board (DIB) Software Acquisition and Practices (SWAP) study group has also provided many insightful and largely compatible recommendations.

NDIA, INCOSE and PSM support the DSB and DIB concepts and the opportunities they offer to DoD and the defense industry.

- NDIA offers the recommendations herein to ASD(A&S) and ASD(R&E) representing an “industry perspective” on path forward.
- NDIA appreciates the opportunity to partner with DoD on implementation.

DSB SW Task Force Recommendations

1. **Software Factory** – A key evaluation criteria in the source selection process should be efficacy of the offeror’s software factory.
2. **Continuous Iterative Development** – DoD and defense industrial base partners should adopt continuous iterative development best practices for software, including through sustainment.
3. **Risk Reduction and Metrics for New Programs** – For all new programs, starting immediately, implement best practices in formal program acquisition strategies (multiple vendors and down-selects, modernized cost and schedule measures, status estimation framework)
4. **Current and Legacy Programs in Development, Production, and Sustainment** – for ongoing development programs, PMs/PEOs should plan transition to a software factory and continuous iterative development.
5. **Workforce** – The U.S. Government does not have modern software development expertise in its program offices or the broader functional acquisition workforce. This requires Congressional engagement and significant investment immediately.
6. **Software is Immortal: Software Sustainment** – RFPs should specify the basic elements of the software framework supporting the software factory... reflected in source selection criteria
7. **IV&V for Machine Learning** – Machine learning is an increasingly important component of a broad range of defense systems, including autonomous systems, and will further complicate the challenges of software acquisition.

The NDIA working group developed consensus recommendations responding to each of the 7 DSB findings:

- Assumptions
- Picture of Success (End State)
- Current State
- Description
- Obstacles
- Path Forward

This briefing is an executive summary of those recommendations. Detailed report provided separately.

Framing Assumptions

Continuous iterative development (CID) methods have cross-functional implications. The scope includes not just **SOFTWARE** but also **SYSTEMS ENGINEERING** and supporting disciplines.

Software Factories include people, processes, and tools – not just a tool chain.

Funding and contracts must be aligned to support implementation and/or migration to SW factories with life cycle sustainment.

A collaborative approach to Intellectual Property (IP) across the entire acquisition life cycle will be developed that meets both Government and Supplier needs.

A business case can be made for the effective deployment and maintenance of integrated tool chains to build capability throughout the life of the system.

Traditional waterfall-based processes, tools, and measures are generally not well suited to CID.

A skilled SW-informed workforce cadre is available or can be developed across functions (e.g., software, acquisition, PMs, sustainment).

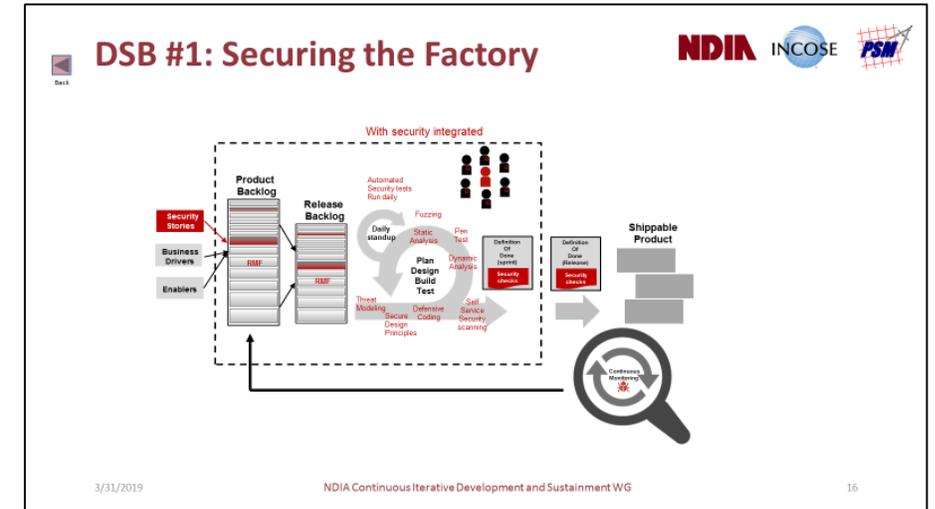

Cross-cutting assumptions. Refer to the separate detailed report with assumptions specific to each DSB recommendation area.

DSB #1: Software Factory

NDIA WG Recommendations

Picture of Success (end state)		
People	<ul style="list-style-type: none"> • Qualified factory workforce 	<ul style="list-style-type: none"> • Continuous learning (relentless improvement, pipeline feedback)
Process	<ul style="list-style-type: none"> • Integrated PMB • Metrics • Predictability 	<ul style="list-style-type: none"> • Digital Blueprint / Play Book • Ontology, Nomenclature • Secure Supply Chain • Relentless Improvement
Tools	<ul style="list-style-type: none"> • Platform agnostic tool chain • Adaptable to change • Test automation at all levels 	<ul style="list-style-type: none"> • Model-based SW validation vs. architecture • Red team / Blue team factory

Security integrated into factory workflows (DevSecOps)

Recommendations for Path Forward:

DSB #1: Software Factory (1 of 3)	
Initiative	Action Plan
Contract for software factory delivery	<ul style="list-style-type: none"> • Create a blueprint of contracts and language to enable software factory delivery • Define approaches for different types of software (e.g., embedded, firmware, web); (life-critical, business-critical, low risk)
Fund value streams instead of projects	<ul style="list-style-type: none"> • Pilot funding a value stream for a single vendor award program • Pilot funding value streams on multi-vendor award program
Incentivize Suppliers to build interoperable software factories that are continuously exercised	<ul style="list-style-type: none"> • Hold workshop with Industry to identify incentives • Pilot options on some small short term modular contracts
Standardize software factory interfaces to facilitate data sharing	<ul style="list-style-type: none"> • Common data architecture • Define standards at the data layer for software factory to enable flexibility • Define common nomenclature standards across vendors; use an existing framework such as the Scaled Agile Framework (SAFe)

DSB #1: Software Factory (2 of 3)	
Initiative	Action Plan
Publish blueprints and playbooks	<ul style="list-style-type: none"> • Collaborate with Industry to obtain software factory blueprints and playbooks and publish for use across programs to increase success
Transparent integrated PMB	<ul style="list-style-type: none"> • Publish blueprint of Integrated PMB (may differ across domains) • Educate Government PMs on how to review PMB
Securing software factory	<ul style="list-style-type: none"> • Define a defense-in-depth approach to secure factory • Identify a required cadence of Red Team / Blue team to ensure factory safe.
Standards-based supply chain	<ul style="list-style-type: none"> • Define supply chain standards • Define interoperability for supply chain with multiple factories
Define value stream for delivery and push varied vendor baselines through factory	<ul style="list-style-type: none"> • Define value stream for delivery and enable multiple vendor baselines to deliver into the factory. • Ensure interoperability

DSB #1: Software Factory (3 of 3)	
Initiative	Action Plan
Measure practices and process for results	<ul style="list-style-type: none"> • Document program practices and processes being used • Measure success of programs by practice and environment to analyze which practices are demonstrating the best results based on customer criteria of value. (not methodology, but individual practice)
DoD-run retrospectives for a sampling of programs	<ul style="list-style-type: none"> • Select a sampling of programs once a quarter and run a retrospective jointly between Industry and Government to identify root causes and improvements • Publish best practices identified in retrospectives for all vendors
Open source	<ul style="list-style-type: none"> • Research approach to leverage Government-based open-sourced ways of working to leverage common modules across vendors and programs
Teams as a service (CID Cells)	<ul style="list-style-type: none"> • Research approach to leverage cross-functional teams as a service in work areas where there is higher availability of workforce.
IATO for infrastructure	<ul style="list-style-type: none"> • Research opportunity to obtain IATO on Infrastructure of software Factory. <ul style="list-style-type: none"> • bare metal / cloud / database (DB) are the longest lead-time items to approve <ul style="list-style-type: none"> ◦ If we could secure a common architecture, the application layer would be cheaper and faster to approve, reducing cycle time for capabilities

PMB: Performance Measurement Baseline

DSB #2: Continuous Iterative Development (MVP)

NDIA WG Recommendations

Picture of Success (end state)	
Government / Contractor Interface	
Contracting	<ul style="list-style-type: none"> • New programs defined by solution intent (CV-1) • Contracts defined by evolutionary viability products (MVP/NVP)
Funding	<ul style="list-style-type: none"> • Contract funding structure supports seamless capability evolution
Stakeholders	<ul style="list-style-type: none"> • Active engagement in CID lifecycle
Design	<ul style="list-style-type: none"> • Guided by MOSA
IP	<ul style="list-style-type: none"> • Government access to source code with negotiated IP protections
Program Execution	
People	<ul style="list-style-type: none"> • Multi-discipline agile execution includes aligned milestones • Direct user/developer interaction informs design (product owner)
Process	<ul style="list-style-type: none"> • Early SE ➤ SW sequencing, refactoring, tools, environments
Tools	<ul style="list-style-type: none"> • Test automation accelerates delivery (rapid release, deployment)

Procurements based on iterative development of releases according to product capability thresholds

Recommendations for Path Forward:

DSB #2: Continuous Iterative Development NDIA WG Recommendations		NDIA INCOSE PSM
Initiative	Action Plan	
Establish CID pilot baseline	<ul style="list-style-type: none"> • Establish & communicate an initial high level CID approach • Establish an initial approach to defining programs for CID implementation • Train key Government and Supplier personnel 	
Pilot, learn and refine	<ul style="list-style-type: none"> • Define a design set for CID • Conduct pilot programs for CID, employing a set based design approach to explore options and refine approach • Iterate until a small set of effective approaches and techniques emerge and standardize on it 	
Implement and evolve	<ul style="list-style-type: none"> • Develop an approach to integrate feedback into the standard process for continuous improvement • Define CID requirement phasing and Inspect and Adapt workshop timing • Roll out CID as standard approach • Manage feedback and evolution 	

CID: Continuous Iterative Development
FOC: Final Operating Capability
IOC: Initial Operating Capability
IP: Intellectual Property

MOSA: Modular Open Systems Architecture
MVP: Minimally Viable Product
NVP: Next Viable Product

DSB #3a: Risk Reduction (Competitive Prototyping)

NDIA WG Recommendations

Picture of Success (end state)	
Competition	<ul style="list-style-type: none"> Business case: win-win partnership, common goals, acquisition/support strategy Objective downselect evaluation criteria (RFP L&M) and feedback Open architecture on critical components
Contracts	<ul style="list-style-type: none"> IP agreement negotiated, sustained across the life cycle Funding and contracts aligned to support factory migration
Metrics	<ul style="list-style-type: none"> Continuous improvement, SMART measures against objectives Risk-based decision making
Resources	<ul style="list-style-type: none"> Funding, staffing, tools, environments to support multiple teams

DSB Recommendation #3 – Risk Reduction
Competitive Prototyping Survey, 2008 (USC CSSE)

Study indicates that CP can help in many situations, but has a number of pitfalls. CP does not solve all acquisition problems.

3/31/2019 NDIA Continuous Iterative Development and Sustainment WG 22

Competitive prototyping can help in many situations, but does not solve all acquisition problems.

Recommendations for Path Forward:

DSB #3a: Competitive Prototyping (1 of 2)
NDIA WG Recommendations

Initiative	Action Plan
Acquisition strategy	Acquisition strategies that provide a fair opportunity to compete, retain competition throughout the lifecycle for critical components to enable rapid evolution of the product.
Competitive prototyping	<ul style="list-style-type: none"> Review analyses/reports from prior DoD competitive prototyping initiatives, and integrate lessons learned into action plan for DSB recommendations. Competitive prototyping risk reduction strategy should account for both functional and non-functional requirements.
Cultural shift	Migrate from subjective qualitative assessment to objective quantitative assessment of risk that support business decisions
Resources	DoD investment to acquire, deploy, integrate, and maintain evaluation tools and test beds
Workforce development	Recommend DoD initiate a development plan to provide workforce with skills and knowledge needed to plan, perform and execute the risk reduction strategies during competitive prototyping.

3/31/2019 NDIA Continuous Iterative Development and Sustainment WG 23

DSB #3a: Competitive Prototyping (2 of 2)
NDIA WG Recommendations

Initiative	Action Plan
Program measurements	<ul style="list-style-type: none"> Define a minimum core set of metrics and ownership for measures needed to do the job at the Program, Functional, and Integrated Product Team (IPT) levels Develop and track metrics to control factory processes, measure against goals and objectives, assess/measure risk, and make decisions Enable real-time insight into measures and program status Ensure measures provide a comprehensive view of risk reduction strategy, including: functional and non-functional requirements; reliability, security, ... Develop consensus Government/Industry measurement framework and common measures applied across defense software acquisition programs.
IP strategy	<ul style="list-style-type: none"> Develop contracting approaches that protect Supplier IP while providing the Government access to source code for analysis, deployment, support, and evolution. Sustain IP required for maintenance of the following: <ul style="list-style-type: none"> Renewable capital – patents, license, IP, ... Human capital – People, skills, experience, surge/slack... Structural capital – data bases, tools, processes, test scripts, ... Relationship capital – customers, supplier agreements, business relationships, personal relationships, ...

3/31/2019 NDIA Continuous Iterative Development and Sustainment WG 24

IP: Intellectual Property
RFP: Request for Proposal
SMART: Specific, Measurable, Achievable, Relevant, Time bound

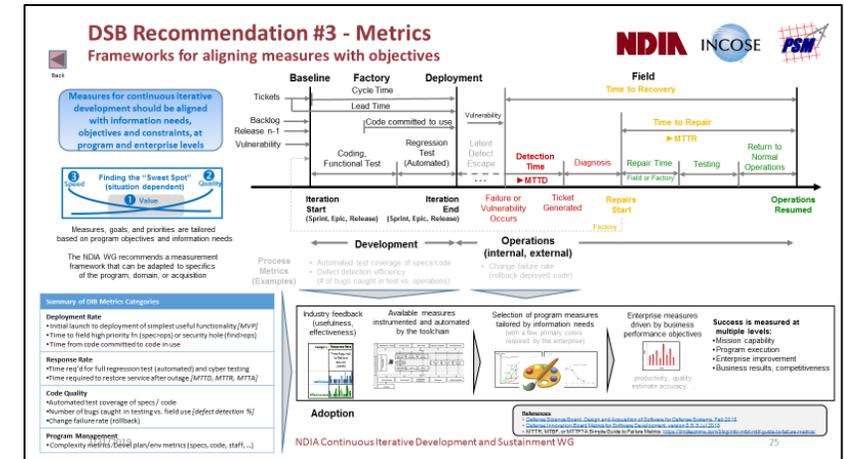

Click thumbnails to zoom

DSB #3b: Measures for CID

NDIA WG Recommendations

Picture of Success (end state)	
Consensus frameworks	<ul style="list-style-type: none"> Objectives first - measures aligned and tailored from information needs, goals and constraints, at program and enterprise levels
Modernized measures	<ul style="list-style-type: none"> Migration toward consensus alternatives to traditional waterfall and phase-based SW measures (LOC, EVM, milestones, ...) Derived from SW factory processes, automated by toolchain Basis for measuring cost and schedule vs. plan
History-based estimates	<ul style="list-style-type: none"> Repositories collect performance-based measures (e.g., WBS, staff, cost, productivity) supporting future comparisons, basis of estimates, proposals, and program monitoring

Measures for CID should be aligned with information needs and constraints, at program and enterprise levels

Recommendations for Path Forward:

Initiative	Action Plan
Software measurement framework for CID	<ul style="list-style-type: none"> Validate measurement framework (objectives, categories, measures) with Government and industry stakeholders (e.g., NDIA, INCOSE, PSM, SERC) Finalize initial consensus measures for software CID Pilot and validate measures/analysis on selected CID / DevSecOps programs. Develop contracting language requiring measurement set for future programs
WBS-based estimating of historical comparables for staff, cost, productivity	<ul style="list-style-type: none"> Recommend DoD expand WBS-based approach and historical DB measures to additional programs but at program level and <u>not specific to continuous software initiatives</u> (doubtful consistent data yet exists). Engage Government stakeholders on historical data estimating initiatives Partner with independent cost estimate (ICE) groups to migrate away from SLOC-based methods (CAPE, PARCA, ICE, ...); establish partnerships with industry for new methods (DSB #3)
Reach consensus on cost and schedule measures vs. plan for software CID	<ul style="list-style-type: none"> Consider alternatives to EVM for managing performance vs. plan. Review EVM agile studies, publications, and guidance. Hold workshops with Industry and Government to define framework and measures. Recommend consensus approach for DoD software acquisition

CID: Continuous Iterative Development
 EVMS: Earned Value Management System
 LOC: Lines of Code
 WBS: Work Breakdown Structure

DSB #4: Transition for Current and Legacy Programs

NDIA WG Recommendations

Picture of Success (end state)		
People	<ul style="list-style-type: none"> • Skill assessment for gap analysis 	<ul style="list-style-type: none"> • Skilled capable workforce for transition on legacy programs
Process	<ul style="list-style-type: none"> • Business case for transition • Playbooks and Blue Prints for legacy code transition • Assessment of supply chain and SW pedigree (FOSS, COTS, GOTS) 	<ul style="list-style-type: none"> • Risk adjusted product backlog • Strategies for incrementally building up test automation
Tools	<ul style="list-style-type: none"> • Tools to generate legacy 'as-built' documentation and models for legacy code base 	

6 Box 6: Example of Legacy Program Moving to Iterative Development: Tomahawk

Tomahawk is currently executing a streamlined, hybrid-Agile approach, with good results. The development approach for Tomahawk add-on, however, is still Waterfall. The program is conducting two-week long sprints over a defined period of time (i.e., the Waterfall spiral time) with the goal of discovering defects earlier, not necessarily shortening the time to completion. The benefit of this process is that shorter sprints allow for periodic deliveries for early integration and testing, as well as cyber scans. This approach will be implemented in full in the next baseline (*Tactical Tomahawk Weapons Control System v5.6.1*).

Defense Science Board, Design and Acquisition of Software for Defense Systems, Feb 2018

See also: Defense Innovation Board SWAP Study Report: [Supplementary Documents, Appendix B.6 Sustainment / Modernization Subgroup Report](#)

Recommendations for Path Forward:

DSB #4: Current and Legacy Programs NDIA WG Recommendations	
Initiative	Action Plan
Program assessment for categories of legacy software programs.	<ul style="list-style-type: none"> • Collaborate with industry building program categorization table for varied types of software and products being built • Define common list of program readiness attributes • Define metrics for how to measure transition success • Develop common risk categories to evaluate • Prototype process for iteratively and incrementally transitioning programs
Supply chain pedigree evaluation tool	<ul style="list-style-type: none"> • Investigate methods for evaluating software pedigree • Prototype process and tools to evaluate supply chain pedigree • Validate pedigree on FOSS/COTS/GOTS/Supplier components
Blueprints and playbooks for low risk transition	Collaborate with Industry to build repository of blueprints, playbooks, and strategies for different types of programs.
Visualization tools for varied code bases.	Investigate Visualization tools for different types of code bases
Auto generate "As-Built" and Models to evaluate system and develop transition plans	<ul style="list-style-type: none"> • Investigate standardized set of tools to auto-generate models and "As-Built" of the varied legacy systems • Define a prioritization strategy for migrating program components to the software factory

COTS: Commercial Off the Shelf
FOSS: Free Open Source Software
GOTS: Government Off the Shelf

DSB #5: Workforce

NDIA WG Recommendations

Picture of Success (end state)		
Education and Training	<ul style="list-style-type: none"> • DAU curriculum for DevSecOps and modern SW-centric systems • Community of practice platforms 	<ul style="list-style-type: none"> • Training across career fields (PM, sustainment, acquisition) • Aligned with current/future development and recruiting needs
Stakeholder Engagement	<ul style="list-style-type: none"> • Collaborative government / industry partnerships • Trained experienced industry partners and supply chain 	<ul style="list-style-type: none"> • Consensus measurement framework • Multi-discipline CID support teams (CDRLs, events, milestones)
Staffing	<ul style="list-style-type: none"> • Increased hiring, retention, training for acquisition experts • Recruiting pipeline for SW experts 	<ul style="list-style-type: none"> • Dedicated workforce funding and coaches across services • PMO IPTs for modern SW practices

Recommendations for Path Forward:

DSB #5: Workforce (1 of 2) NDIA WG Recommendations	
Initiative	Action Plan
Modern software-intensive-systems engineering competency model development	<ul style="list-style-type: none"> • DAU/INCOSE/NDIA/ISO collaboration to add software-centric systems engineering roles and proficiencies to INCOSE SE competency model and identify / develop workforce development content to improve proficiency • Create ability to ID/code software-intensive-systems engineering in current/future software-centric systems skillsets
Informed PMs and software SMEs Training	<ul style="list-style-type: none"> • Development and deploy training at Defense Acquisition University on iterative software development for all acquisition communities (PM, Systems Engineering, Software, Financial Management, Cost Estimating, ...) • Develop a consensus government/industry measurement framework and common measures applied across defense software acquisition programs • Supply chain integration - Deploy supply chain pedigree evaluation tools and techniques • Develop blueprints and playbooks for low risk transition • Develop RFP guide for acquiring and transitioning to software factories

DSB #5: Workforce (2 of 2) NDIA WG Recommendations	
Initiative	Action Plan
Workforce management	<ul style="list-style-type: none"> • Baseline current software intensive capabilities and needs <ul style="list-style-type: none"> • Identify workforce gaps; quantity/quality • Update workforce needs to shape workforce recruitment and training • Create a new software-centric-systems Engineering 0800 Occupational Series to enable tracking, management and growth of software-centric-systems engineers, managers, and functional personnel <ul style="list-style-type: none"> • Fund software intensive develop training • Support continuous learning

CDRL: Contract Data Requirements List
 CID: Continuous Iterative Development
 DAU: Defense Acquisition University
 IPT: Integrated Product Team
 PM: Program Manager
 PMO: Program Management Office

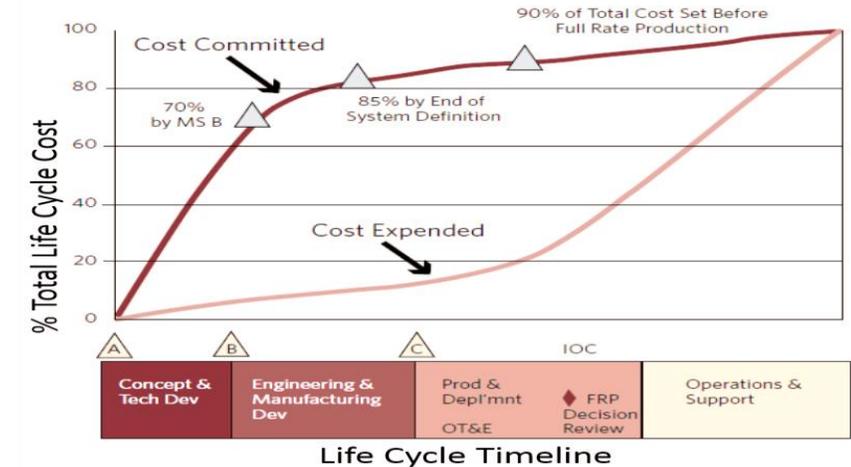

Click thumbnails to zoom

DSB #6: Sustainment (Software Is Immortal)

NDIA WG Recommendations

Picture of Success (end state)	
Resources	<ul style="list-style-type: none"> • Availability and support of a trained proficient workforce • Organic DoD software infrastructure, incentives, funding • Collaborative IP strategy throughout the life cycle, using a “work shared sustainment” approach
Contracting Language	<ul style="list-style-type: none"> • Contracts specify elements of framework supporting SW factory • Policies and guidance validated by workshops, pilots
Sustainment Ecosystems	<ul style="list-style-type: none"> • Understanding of current and future organizational ecosystems to ensure effective transfer of SW factories

Recommendations for Path Forward:

DSB #6: Software Sustainment NDIA WG Recommendations		NDIA INCOSE PSM
Initiative	Action Plan	
Develop contracting language that contains the basic elements of the software framework supporting the software factory	<ul style="list-style-type: none"> • NDIA workshop with government and Supplier personnel • Generation and socialization of proposed contracting language • Conduct a set of pilot programs • Develop policies and guidance 	
Develop an understanding of the current and future sustainment organizational ecosystems to ensure the effective transfer of the software factories.	<ul style="list-style-type: none"> • NDIA workshop with government and contractor personnel • Generation and socialization of effective transfer mechanism • Conduct a set of pilot programs • Develop polices and guidance 	

3/31/2019 NDIA Continuous Iterative Development and Sustainment WG 30

Click thumbnails to zoom

DSB #7: IV&V for Machine Learning

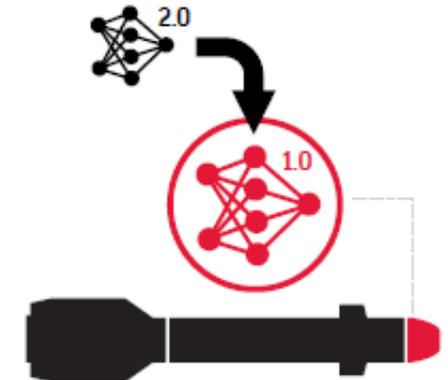

NDIA WG Recommendations

Picture of Success (end state)	
Consensus ML IV&V Framework	<ul style="list-style-type: none"> • Model-based inference engine considering full system context • Risk-based methodology supporting T&E needs, linked to ML model failures early in system development process • Mitigation throughout system design, development, sustainment
Open Data Sets	<ul style="list-style-type: none"> • High data quality, quantity, availability, and traceability • Data repository accessible to government and industry • Governance model for availability, level playing field, innovation • New repository data continuously collected and published
Perpetual Updates	<ul style="list-style-type: none"> • Continuous ML model updates – evolution at speed of relevance • Continuous V&V methods sensing changes from models, environment • Performance/accuracy aligned with changing environment, threats

T&E is a full lifecycle activity focused on mitigating risk of failing to meet operational needs

Perpetual Upgrades

Recommendations for Path Forward:

IV&V: Independent Verification & Validation
ML: Machine Learning
T&E: Test and Evaluation

DSB #7: IV&V for Machine Learning (1 of 2) NDIA WG Recommendations		NDIA	INCOSE	PSM
Initiative	Action Plan			
Adopt a risk-based framework	Deploy a risk-based framework for managing ML risk in the same way that cyber risk is managed <ul style="list-style-type: none"> • For the IV&V needs associated with ML in the system, use the mitigation of associated risks as a core part of the test and evaluation process 			
Research and experimentation programs should place a primary focus on approaches to mitigate risks	Pilot R&D programs focused on approaches such as: <ul style="list-style-type: none"> • Data quality techniques to assess if training data sufficiently represent real-world distributions • Run Time Assurance (RTA) approaches • Formal methods and other approaches to prove correctness of ML models • Enhancing trust in ML systems (see DARPA Explainable AI (XAI)) 			
Address ML risks/concerns within CONOPS and architecture	Standardize approaches to evaluating ML risk in the system, and develop playbook of, CONOPS, architectural frameworks, and design patterns to mitigate these types of risk <ul style="list-style-type: none"> • The risks associated with ML in a system depends on how that ML model impacts overall system behavior • We can manage risk levels through CONOPS and system architecture decisions 			

3/31/2019 NDIA Continuous Iterative Development and Sustainment WG 31

DSB #7: IV&V for Machine Learning (2 of 2) NDIA WG Recommendations		NDIA	INCOSE	PSM
Initiative	Action Plan			
Ensure data availability and traceability across industry	Establish a data exchange that is not just a simple repository/dumping ground for data... Instead espousing a governance model and necessary security controls <ul style="list-style-type: none"> • DIB: "All data generated by DoD systems - in development and deployment - should be stored, mined, and made available for machine learning (ML)" • To allow for greater innovation, make all this data available to industry via a secure data repository/exchange • Include requirements for maintaining history, provenance and pedigree of data sets and ML models, and maintain data/model traceability • Continuous V&V methods tied to sensing of changes from models & environment 			
Software factory considerations for ML systems	Ensure that evaluation criteria for a "Software Factory" considers the special needs of ML systems: <ul style="list-style-type: none"> • Evaluation criteria for Software Factories must consider the special needs of development and deployment for ML (models need to be rapidly re-trained, re-tested, re-deployed) Software factory considerations include: abundant storage for training/validation data, ample compute (e.g., Graphics Processing Units (GPUs), Tensor Processing Units (TPUs)) to support training runs, etc.

Summary

The NDIA WG provides an industry perspective on picture of success, current state, obstacles and path forward for each DSB recommendation

DSB Recommendation	NDIA “Path Forward” recommendations	
#1 – Software Factory	14	Contracting, funding, incentives, methods, security, supply chain, and measures
#2 – Continuous Iterative Development	3	Pilots and continuous improvement
#3 – Risk Reduction & Metrics	10	Acquisition strategy, competitive prototyping, culture, workforce, IP, and measures
#4 – Legacy Systems	5	Assessments, supply chain, methods, tools, and modeling
#5 – Workforce Development	3	Competency models, workforce assessment, workforce management, and training
#6 – Sustainment	2	Contracting and industry-government transfer of sustainment responsibilities
#7 – Machine Learning	5	Risk, research, CONOPs, ML data, and Software Factory interactions

Details of each topic and recommendation are provided in the separate report.

Acknowledgments

The NDIA Systems Engineering Division and its partners, INCOSE and PSM, appreciate the opportunity to provide an industry perspective for advancing the use of iterative methods in defense software acquisition.

The defense industrial base embraces the opportunities offered by the DSB and DIB recommendations and looks forward to supporting the Department of Defense with implementation.
