

Automating USMC Software Releases for TSOA A DoD DevOps Case Study

Andrew Marks
SSC Pacific, Command and Control
20 April 2017

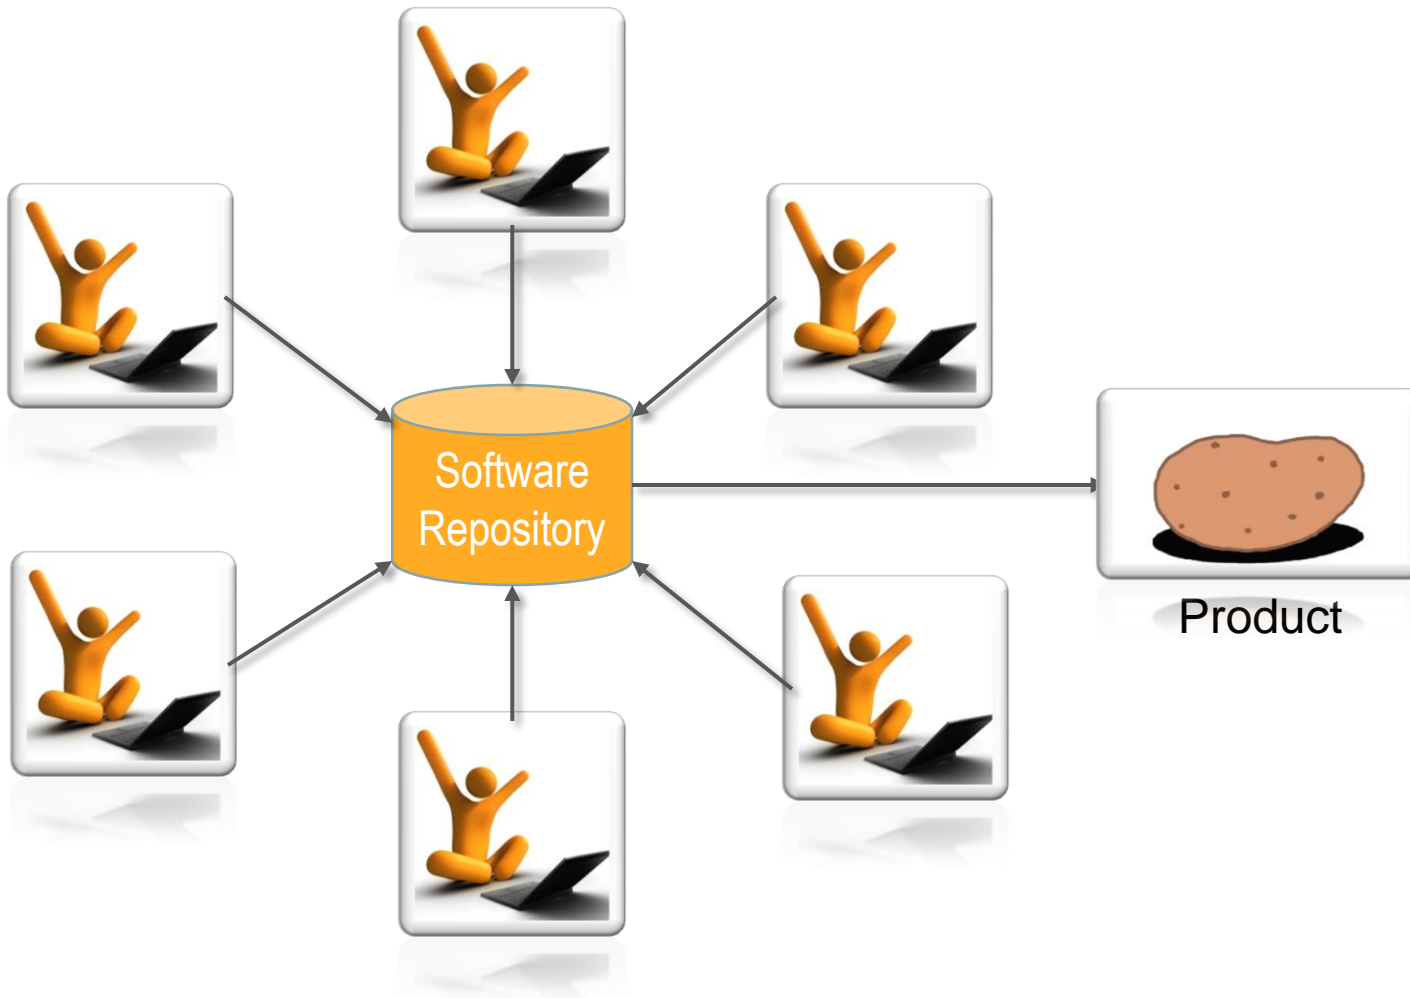

DevOps Summary and Goal

DevOps Goal

Push-Button Releases To End-Users

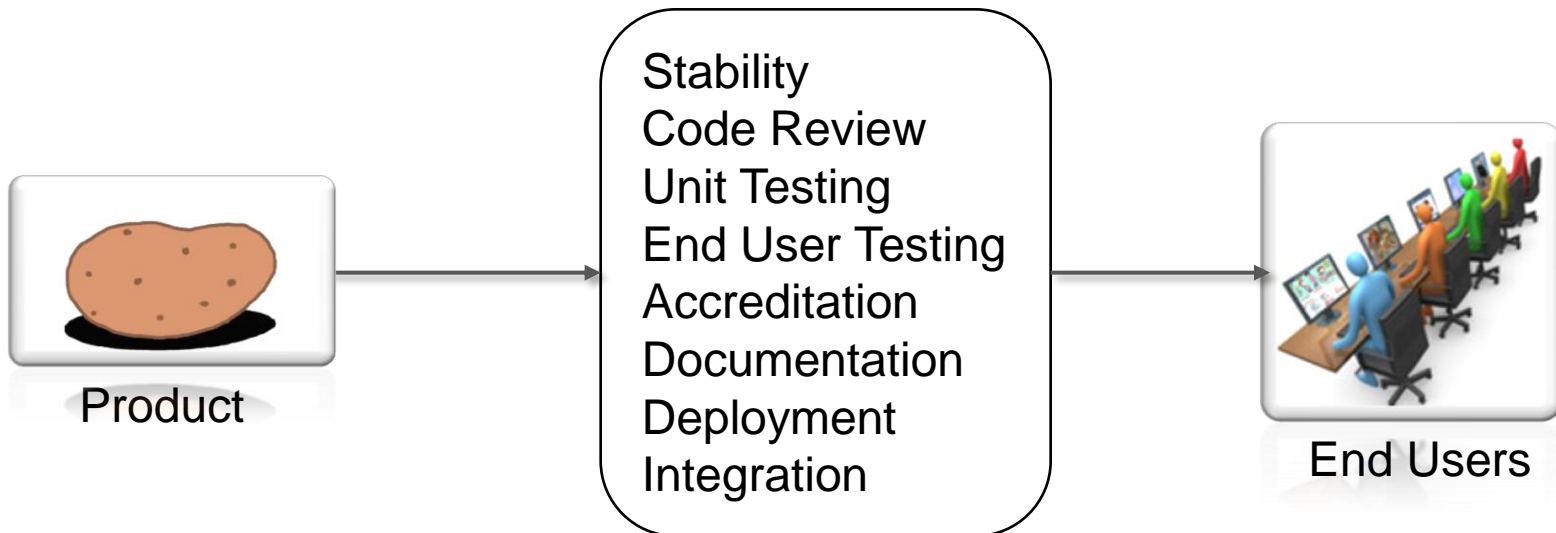

Software Development Workflow (2011)

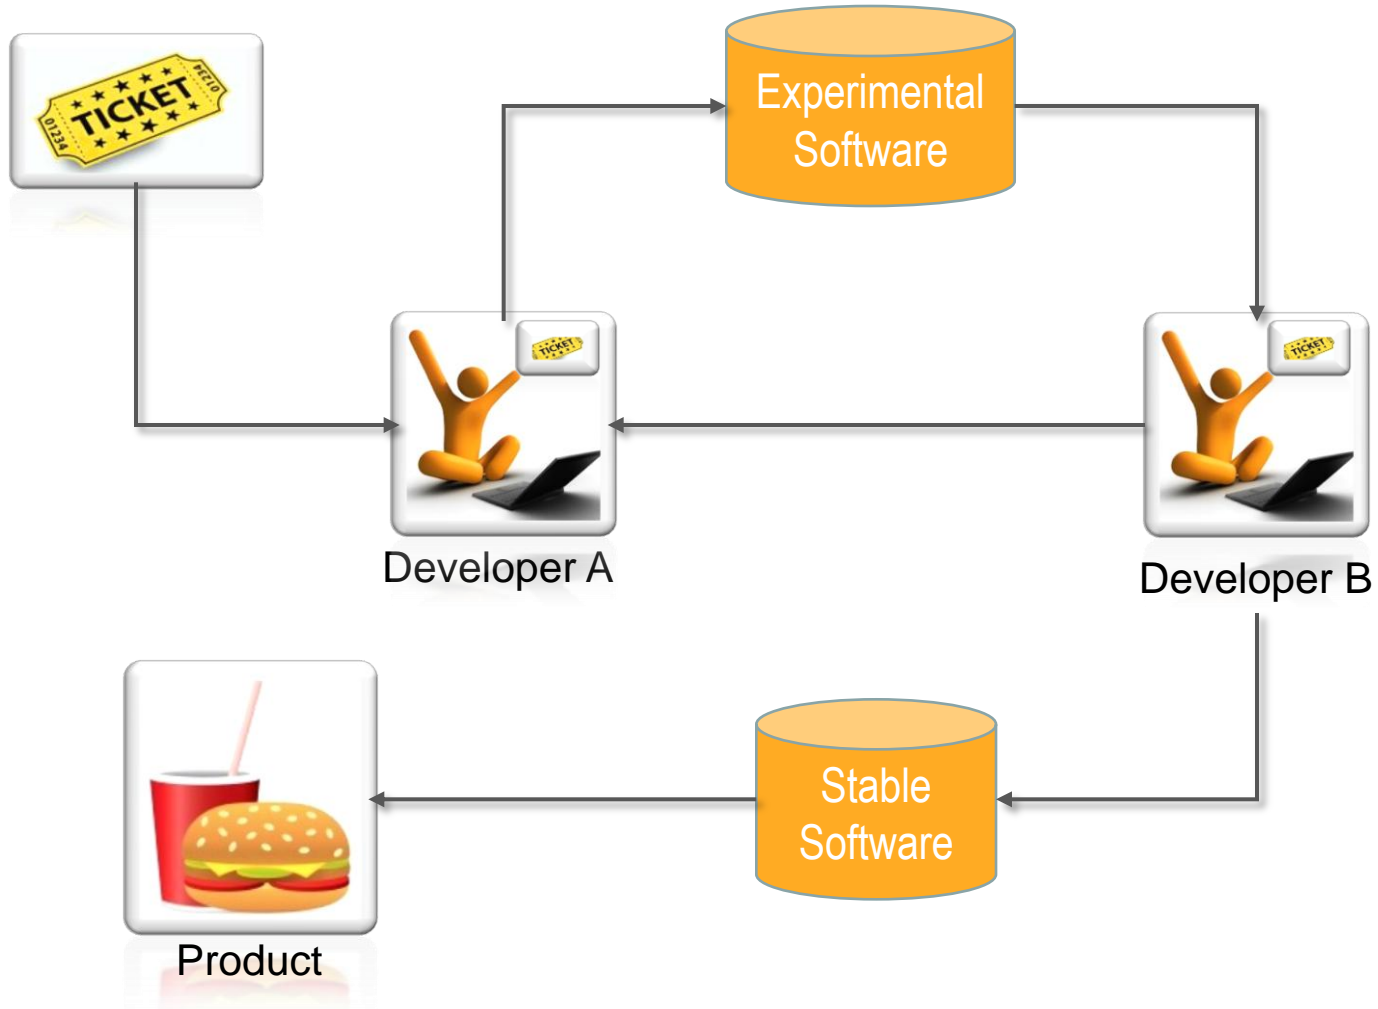

Software Development (2011)

▼ Software Development Process

- DevOps consists of only revision control
- Unstable, unreliable code in main/production branch
- Little to no Continuous Integration (CI)
- Lots of post-development cleaning
- Lots of breath-holding at SCRUM demonstrations

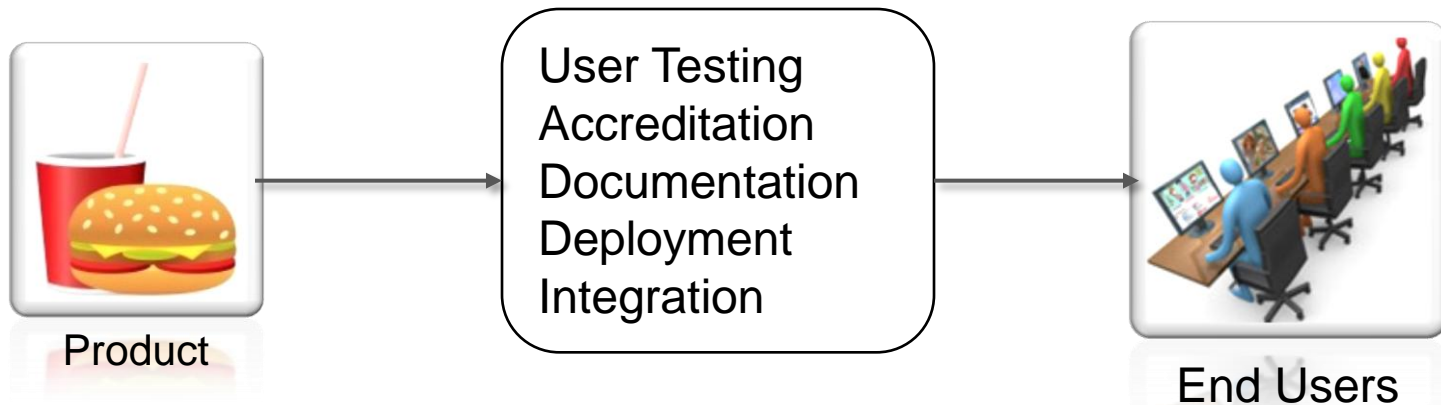

Software Development Workflow (2014)

Software Development (2014)

▼ Software Development Process

- Every line of source code must be related to a ticket/tracker
- All development occurs on experimental branches, not production
- All software must be reviewed before merging with production
- Reviewer shares responsibility with original developer

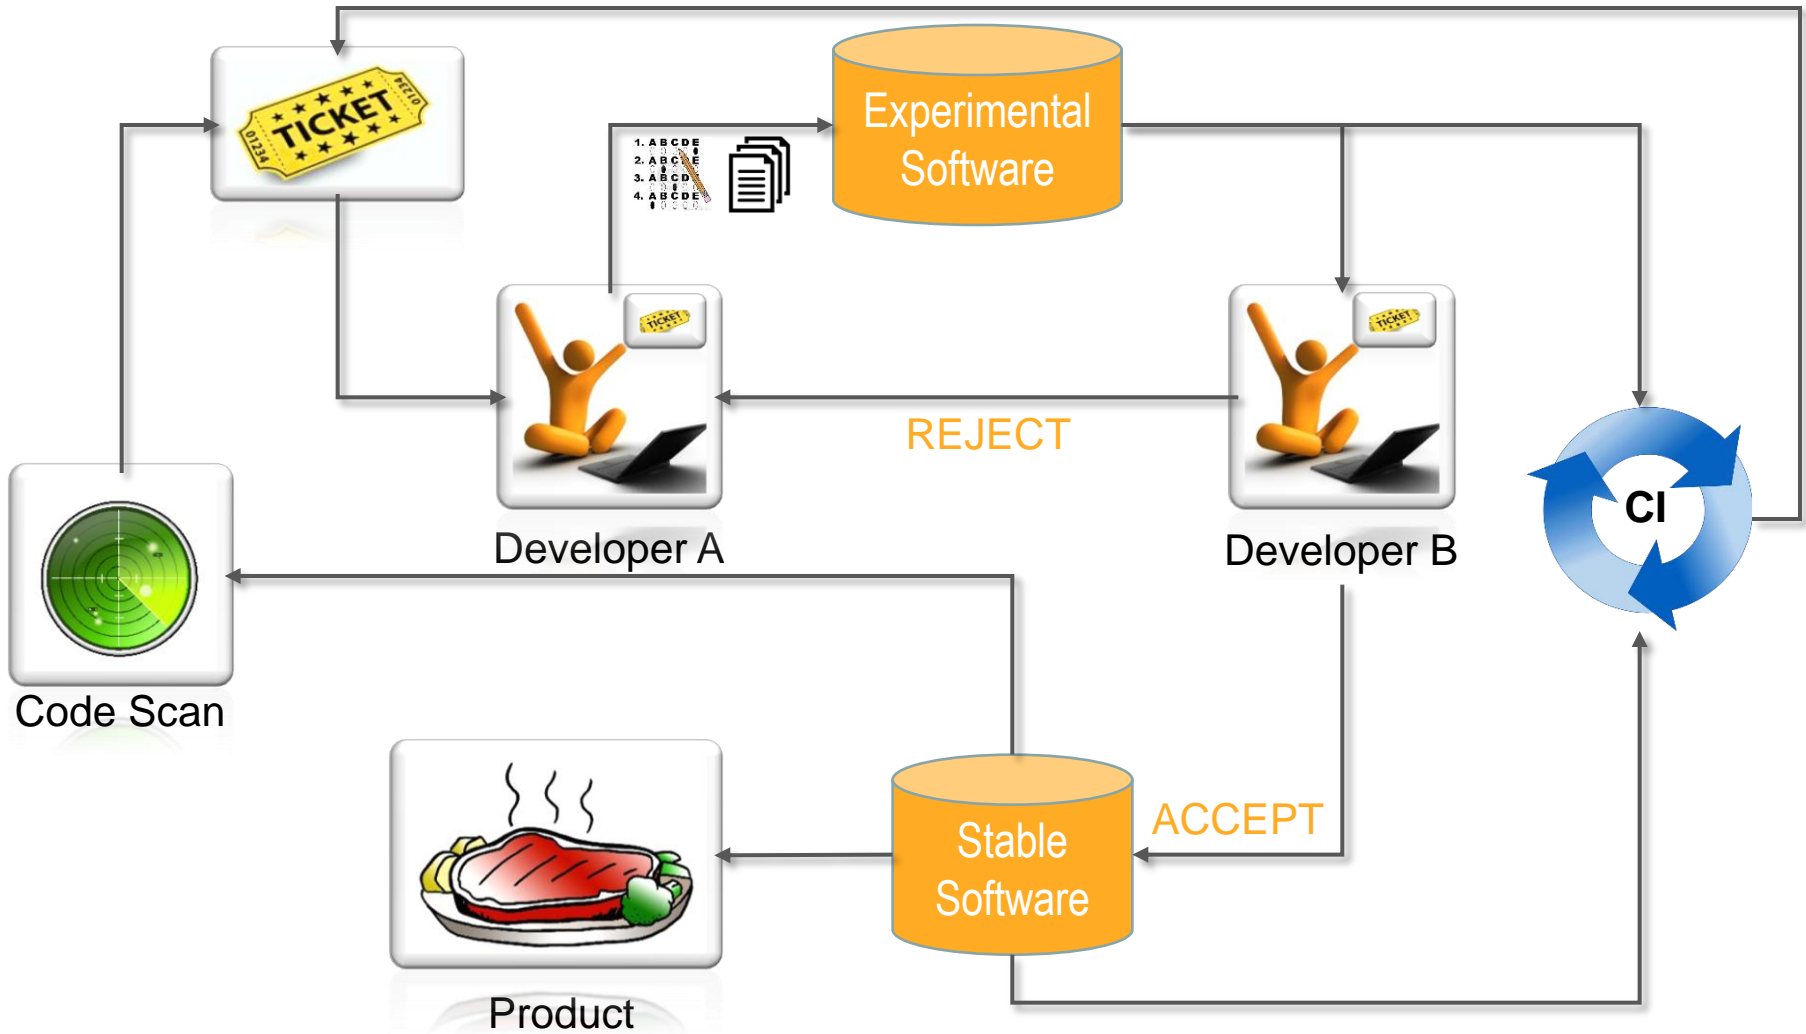

Workflow Leave-Behind

- ▼ Attached zip file contains the workflow project from 2014. Please feel free to try this out on your software development efforts.

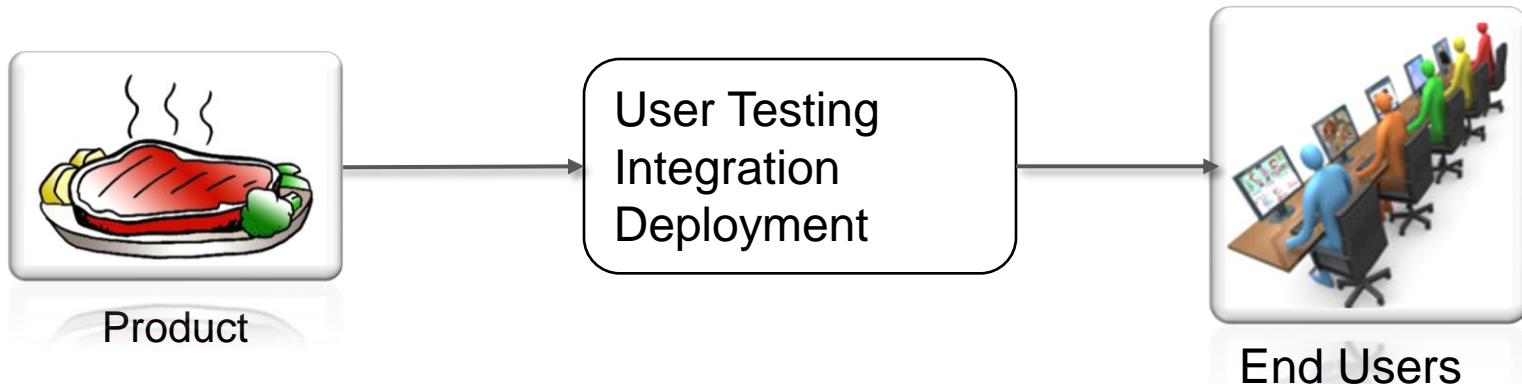

workflow.zip

Software Development Workflow(2016)

Software Development (2016)

- ▼ Adding Accreditation to the pipeline
 - Include IA representatives at all relevant SCRUM meetings
 - Incorporate Daily HP Fortify Scans
- ▼ Adding Documentation to the pipeline
 - Migrated all documentation from MS Office to LaTeX
 - Documentation lives in repository along-side source code
 - End-User PDFs and In-Product documentation are developed from the same source

Enhancements for 2017

- ▼ Automated End-User Testing
- ▼ Automated TSOA Integration
 - R2I DevOps are local at SSC Pacific
 - Other supporting organizations have their own internal DevOps processes
 - Final integration for the USMC TSOA project is still a manual process

TSOA Integration (2017)

TBD: DevOps Operations

- ▼ USMC software release approval is still a paper-driven process
- ▼ Digital distribution is partially solved by Marine Corps Software Resource Center (MCSRC)
- ▼ Nature of Defense work complicates some DevOps Operations
 - Software Updates
 - Software Configuration on the deployed system
 - Feedback from end-systems (Metrics/Health)

Thank You
